OCTOBER 2021 | VOLUME 32 NO. 10

OCTOBER TIN MARKET REVIEW

Kuala Lumpur Tin Market (KLTM)

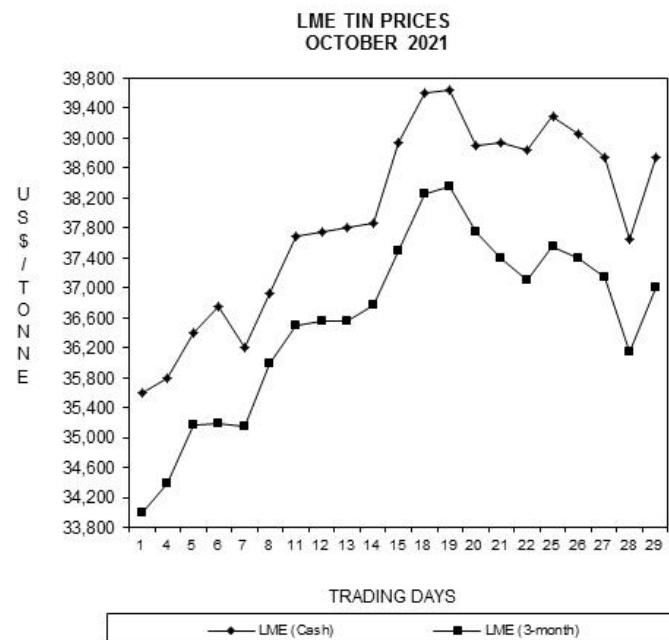

Tin trading on the KLTM continued to be suspended during the month of October. The suspension which began on 9th June 2021 would remain until Malaysia Smelting Corporation Berhad (MSC) lifts its Force Majeure declaration that was made on 7th June 2021.

London Metal Exchange (LME)

Bolstered by strong demand, tin trading on the LME during the month of October was mostly on an upward momentum, and conducted within a wide price range of some US\$4,000 per tonne. Trading was much stronger than that recorded during the September trading month, and again followed the same trading pattern as the other base metals traded on the Exchange.

The October average LME cash tin price was US\$37,962 per tonne while the average 3-month tin price was US\$36,567 per tonne.

The market opened the October trading month at US\$35,600 per tonne for cash tin and US\$34,000 per tonne for 3-month tin, both being their lowest price level for the

month, respectively. It was the only trading day of the short first trading week.

Strong demand boosted the tin price almost throughout the second trading week with a technical correction checking the upward momentum during its second last trading day.

The upward trend continued throughout the third trading week. Buyers dominated the market with prices being in-line with those of the other base metals traded on the Exchange.

The tin price rose further during the first two days of the fourth trading week to record the month's highest level at US\$39,650 per tonne for cash tin and US\$38,350 per tonne for 3-month tin, both recorded on 19th October. Thereafter, it softened to end the trading week lower.

A technical correction lifted the tin price at the opening of the final trading week before easing for three consecutive days. It rebounded at end of the trading week to close the trading month of October at US\$38,750 and US\$37,000 per tonne for cash and 3-month tin, respectively.

NEWS HIGHLIGHT

New Plant to Boost Margins for MSC

Tin prices have hit an all-time high and are likely to remain strong, at least in the near-term, as power cuts in China persist. A beneficiary of this is Malaysia Smelting Corp (MSC) Bhd, which is currently trading at "cheap valuations of four times 2022 forecast price to earnings (PE) at the spot price of circa US\$35,000 (RM146,230) per tonne," according to UOB Kay Hian (UOBKH) Research. As of Sept 24, the London Metal Exchange (LME) tin prices have risen to an all-time high of about US\$37,000 (RM154,586) per tonne - an increase of 116% year-on-year.

A mix of factors, from pandemic-led supply disruptions and growing pent-up demand, has contributed to the rally of tin prices this year. While prices may ease gradually entering 2022, the research firm believes that prices would remain firm in the long run, albeit not at the current high, as the structural supply issue may persist.

"If tin price remains high at this current level in 2022, this could result in a 20% upside to our target price of RM3.02 at RM3.61," it said in a note to clients.

Business-wise, a more meaningful growth will be seen in 2022 when its new eco-friendly plant runs at 100% capacity. MSC's production will be done at its new smelting plant in Pulau Indah as it shuts down its 100-year-old reverberatory furnaces in Penang.

"The new smelter boasts production costs that are at least 20% lower than the old ones. This is due to the state-of-the-art technology which uses a top submerged lance furnace

that provides better efficiency via its single-stage smelting versus multistage smelting process used previously," said UOBKH Research.

The plant will also have 50% higher production capacity while requiring over 40% less manpower. This will also help reduce MSC's carbon footprint through the use of natural gas, solar panels and waste heat recovery. The research firm noted that despite the movement control order (MCO), MSC posted a healthy net profit of RM25mil for the first half of 2021 compared with a net loss of RM12.3mil in the same period in 2020.

"As the MCO eases, MSC is currently operating at 100% workforce capacity. As such, we can expect stronger earnings moving forward as MSC ramps up its production. We believe the drop in production this year will be partially mitigated by the lofty tin prices," it added.

According to the research firm, the group is expected to post a three-year (2021-2023) earnings compound annual growth rate of 97% as it is poised to benefit from strong tin prices and robust structural demand from the potential adoption of next generation technologies amid the market's supply shortage. MSC's future growth will be further supported by exploration of new mines and development of its Butterworth land, it added. Shares of MSC closed at RM2.27 last Friday, giving the stock a market cap of RM953mil.

NEWS ROUND-UP

Deeper Mineralisation Confirmed at Uis Mine

AfriTin Mining, the owner and operator of the Uis tin mine in Namibia, has confirmed mineralisation at depth from the results of the final drill holes. The mine has been in operation since late 2019, and has produced almost 600 tonnes of tin-in-concentrate from its existing V1/V2 pit.

The company's main focus is on expansion as the mine is now in steady-state operations. AfriTin plans to start expanding the Uis processing plant after it confirmed the viability of the Phase 1 Expansion project through its Definitive Feasibility Study (DFS) in May.

The Phase 1 Expansion DFS highlights recoveries of both lithium and tantalum as key minerals. However, neither has a JORC-compliant Mineral Resource yet at Uis. The latest drill-

ing campaign has been focused on providing data for this exercise, and to prove that the tin mineralisation also extends at depth.

Assayed drill cores returned tin grades between 0.156 to 0.171 per cent Sn, in line with average feed grades currently being achieved at the mine. According to a company spokesman, they are "pleased" with the results and commented that the "high-grade drill hole intersections substantiate our belief that AfriTin Mining is poised to become a leading supplier of technology metals targeting a more diversified portfolio of production in the future."

Metals X to Expand Renison Exploration Programme

Metals X, Australia's largest tin producer, has announced that it will start an exploration campaign across its Renison mining lease in the final quarter of 2021.

The company has been focusing on extending mineralisation within its Renison mine via its Bluestone Mines Tasmania Joint Venture (BMTJV) during the past years. Results of this work have been positive, with the addition of the Area 5 high-grade sector of the mine a particular highlight. However, Metals X is now looking slightly further beyond.

Soil geochemistry is a crucial technique for early exploration work, which is courser but cheaper, and a more rapid method for generating drilling targets. Soil is collected and analysed for a wide range of minerals, which can be associated directly with target sequences or their alteration halos. For example, a study by BMTJV in 2018 found that high arsenic, bismuth, antimony and indium values can be associated with the tin mineralisation at Renison.

Renison has not employed soil geochemistry since the 1970's, and a 2019 review of the 1960's and 1970's data have identified anomalous zones of zinc, copper, arsenic and tin to the south of the existing Renison Mine site.

These zones will be covered extensively in the planned soil sampling program where some 742 samples will be collect-

ed over 75km of tracks, primarily in these anomalous zones, but also stretching further afield. Results from the soil assays will be combined with the historical data to highlight new potential tin-bearing areas or to identify high priority drilling targets.

BMTJV will also be employing geophysics to assist its regional exploration efforts alongside the geochemistry.

Three new diamond drill holes will be completed totalling some 1,800m targeting highly electromagnetically conductive zones. These zones were identified in a 2019 down hole electromagnetic survey program. Metals X and BMTJV will have a better understanding of the conductive signatures from the result of this work, which may help to point future exploration efforts to tin or other mineralised zones.

The above techniques may become applicable if BMTJV is granted a new exploration licence. The JV has applied for one directly nearby to the Renison Mining Lease, immediately to the north and west. This area includes the north-west extension of the Federal-Bassett fault, which is the main structural control on tin mineralisation in Renison, as well as the mine stratigraphy. New exploration and integration of historical data, could reveal new mineralisation areas.

Venture Minerals Pushing Ahead its Mount Lindsay Project

Venture Minerals (VM), an Australia-based mineral exploration company, has started working on a Feasibility Study for an underground mine at its Mount Lindsay project.

Located in Tasmania, Mount Lindsay lies within the same tin field that hosts the Renison tin mine, and has been in development for a number of years. The maiden tin and tungsten resource was announced in 2009, containing some 49,000 tonnes of tin at a grade of 0.2 per cent Sn. The company completed a Bankable Feasibility Study (BFS) for the project in 2012, which suggested that tin could be mined for just A\$59 per tonne from a combined open pit and underground operation.

Significant progress has been made since then as Mount Lindsay is now known to contain nearly double the amount of tin at some 81,000 tonnes at a grade of 0.2 per cent Sn. However, there is still more to be done.

VM is aiming to publish a Feasibility Study for the project, which will detail initial plans for Mount Lindsay's mining and processing. This project will be based on the results of the previous scoping studies as well as upcoming work, such as further drilling and engineering studies.

Additional drilling is needed to confirm whether the high-grade MacDonald and Radford offshoots of the known mineralised skarns continue over significant distance. Drilling has started, and the extracted material will also be used as part of processing testwork to finalise the mine's flow-sheet. Processing at Mount Lindsay will likely be gravity-focused, due to the amenability of cassiterite to dense media separation methods. Given changes to the mining and processing strategies, further work will be required to firm up the mine design and update the mining permit for Mount Lindsay.

* : The figures include high-grade tin (99.9% Sn) imported for consumption.

** : Preliminary.

n.y.a : not yet available

Sources : Department of Mineral and Geoscience Malaysia
Malaysia Smelting Corporation Bhd
Perstima Bhd

Note : Local consumption of tin metal refers to the use of tin in a particular application.
Sales to manufacturing industries have been used as proxy for consumption except
in the case of manufacture of tinplate which are actual tin consumption data.

WORLD MINE PRODUCTION (In Tonnes)

WORLD REFINED TIN CONSUMPTION (In Tonnes)
